

Heuristic Evaluation Report

No	Heuristic	Issue Description	Screenshot	Severity	Suggested Improvement
1	H1-1: Simple & natural dialog	The main page displays a metrics panel showing Total conversations, Active conversation, and Today's date. This data is irrelevant and confusing for regular users. The panel also shows logically inconsistent data — active conversations (3) exceeded total conversations (2), which is impossible.		3 – Major	Remove the metrics panel from the main user view or move it to an admin/settings page. Fix the calculation logic to ensure data consistency.
2	H1-2: Speak the users' language	No issues found. All three supported languages (English, Arabic, Japanese) translated the UI correctly. No technical terms or API-style language was exposed to users.	—	0 – No problem	—
3	H1-3: Minimize users' memory load	To start a conversation the user must manually enter the other person's numeric User ID. The user's own ID is never shown anywhere in the interface. There is no way to view participants of an existing conversation. The new conversation dialog has only one ID input field, making group chat creation unclear.		3 – Major	Add user search by name or email. Display the user's own ID in profile settings. Show a participant list inside conversations. Add a dynamic 'add user' button for group conversations.
4	H1-4: Consistency	Two issues found: (1) The 'Start a conversation' button is blue, clashing with the purple color theme used throughout the app. (2) On the sign-in page, the language selector label and dropdown are misaligned and appear visually disconnected.		2 – Minor	Change the button color to match the purple theme. Fix the language selector alignment on the sign-in page using consistent CSS layout.
5	H1-5: Feedback	No issues found. Messages appear instantly after sending. All UI actions are responsive and provide timely visual feedback.	—	0 – No problem	—
6	H1-6: Clearly marked exits	Once a conversation is opened, there is no way to close or deselect it. A conversation always remains in an open state with no dismiss or close option available.	—	2 – Minor	Add a close or deselect option for the active conversation, such as an X button or a back arrow that returns the user to a neutral state.

No	Heuristic	Issue Description	Screenshot	Severity	Suggested Improvement
7	H1-7: Shortcuts	No significant shortcut issues found. Enter to send is the primary and expected shortcut for a chat application of this scope.	—	0 – No problem	—
8	H1-8: Precise & constructive error messages	When entering a non-existent User ID, the error reads: "User(s) not found: [3]". Square brackets expose internal formatting and the message does not guide the user on what to do next.		1 – Cosmetic	Replace with a clear message: "No user found with this ID. Please check and try again." Remove internal formatting characters from user-facing output.
9	H1-9: Prevent errors	The metrics panel shows logically inconsistent data: Active conversation count (3) is greater than Total conversations (2). This indicates missing validation or a logic error that can mislead users and reduce trust.		2 – Minor	Add validation to ensure displayed metrics are logically consistent. Active conversations should never exceed total conversations. Add unit tests for metric calculation logic.
10	H1-10: Help and documentation	No help section, tooltips, or onboarding guide exists. New users have no way to understand what a User ID is, how to find it, or how the application works in general.	—	2 – Minor	Add a help button or ? icon with a short usage guide. Add tooltips on key UI elements such as the User ID input field. Consider a brief onboarding flow for first-time users.
